

Hello,

The current folder contains the source code files corresponding to Figure 2 in the paper.

Step 1: You can execute "[AlexNet image predict.py](#)" to perform a class prediction on "(a) original image".

Step 2: You need to execute "[target attack.py](#)" to perform a targeted attack and generate adversarial samples.

Step 3: You need to execute "[Image probability enhancement.py](#)" to enhance the confidence of the adversarial samples in the specified category.

Step 4: You need to execute "[Create perturbing data images of the original and tampered images.py](#)" to generate the perturbation information.
