

Hello,

The current folder contains the source code files corresponding to Table 1 to Table 6 in the paper. It includes two subfolders and one file: "order.exe", which are required for GMA. The two subfolders represent targeted ablation and untargeted ablation, respectively.

Step 1: You need to add the corresponding parameters to the "GMA.py" file in both the targeted and untargeted ablation subfolders. For detailed setup instructions, refer to the instructions in the source code.

Step 2: Then, the adversarial samples with less perturbation information obtained through the ablation of the approach GMA with the adversarial samples generated by existing methods as inputs by running "GMA.py".
